

**EUROPEAN  
SPALLATION  
SOURCE**

# Research infrastructures as scientific cloud providers

ESS as a case study

PRESENTED BY JESPER RUDE SELKNÆS

2022-10-11

# Agenda

- 1 Introduction to ESS
- 2 The Data Management and Software Center
- 3 Concrete technologies used at DMSC
- 4 Summing up

# European Spallation Source

What it's all about

To build and operate the world's most powerful neutron source enabling scientific breakthroughs in research related to materials, energy, health and the environment, addressing some of the most important societal challenges of our time

# A coalition of 13 European countries

## Host countries

Sweden, Denmark

Budget for construction €1.84 billion  
Estimated annual budget €140 million

## Non host member countries

Czech Republic, Estonia, France, Germany, Hungary, Italy, Norway, Poland, Spain, Switzerland, United Kingdom.

# Timeline

# Work in progress

From green field to a state of the art RI

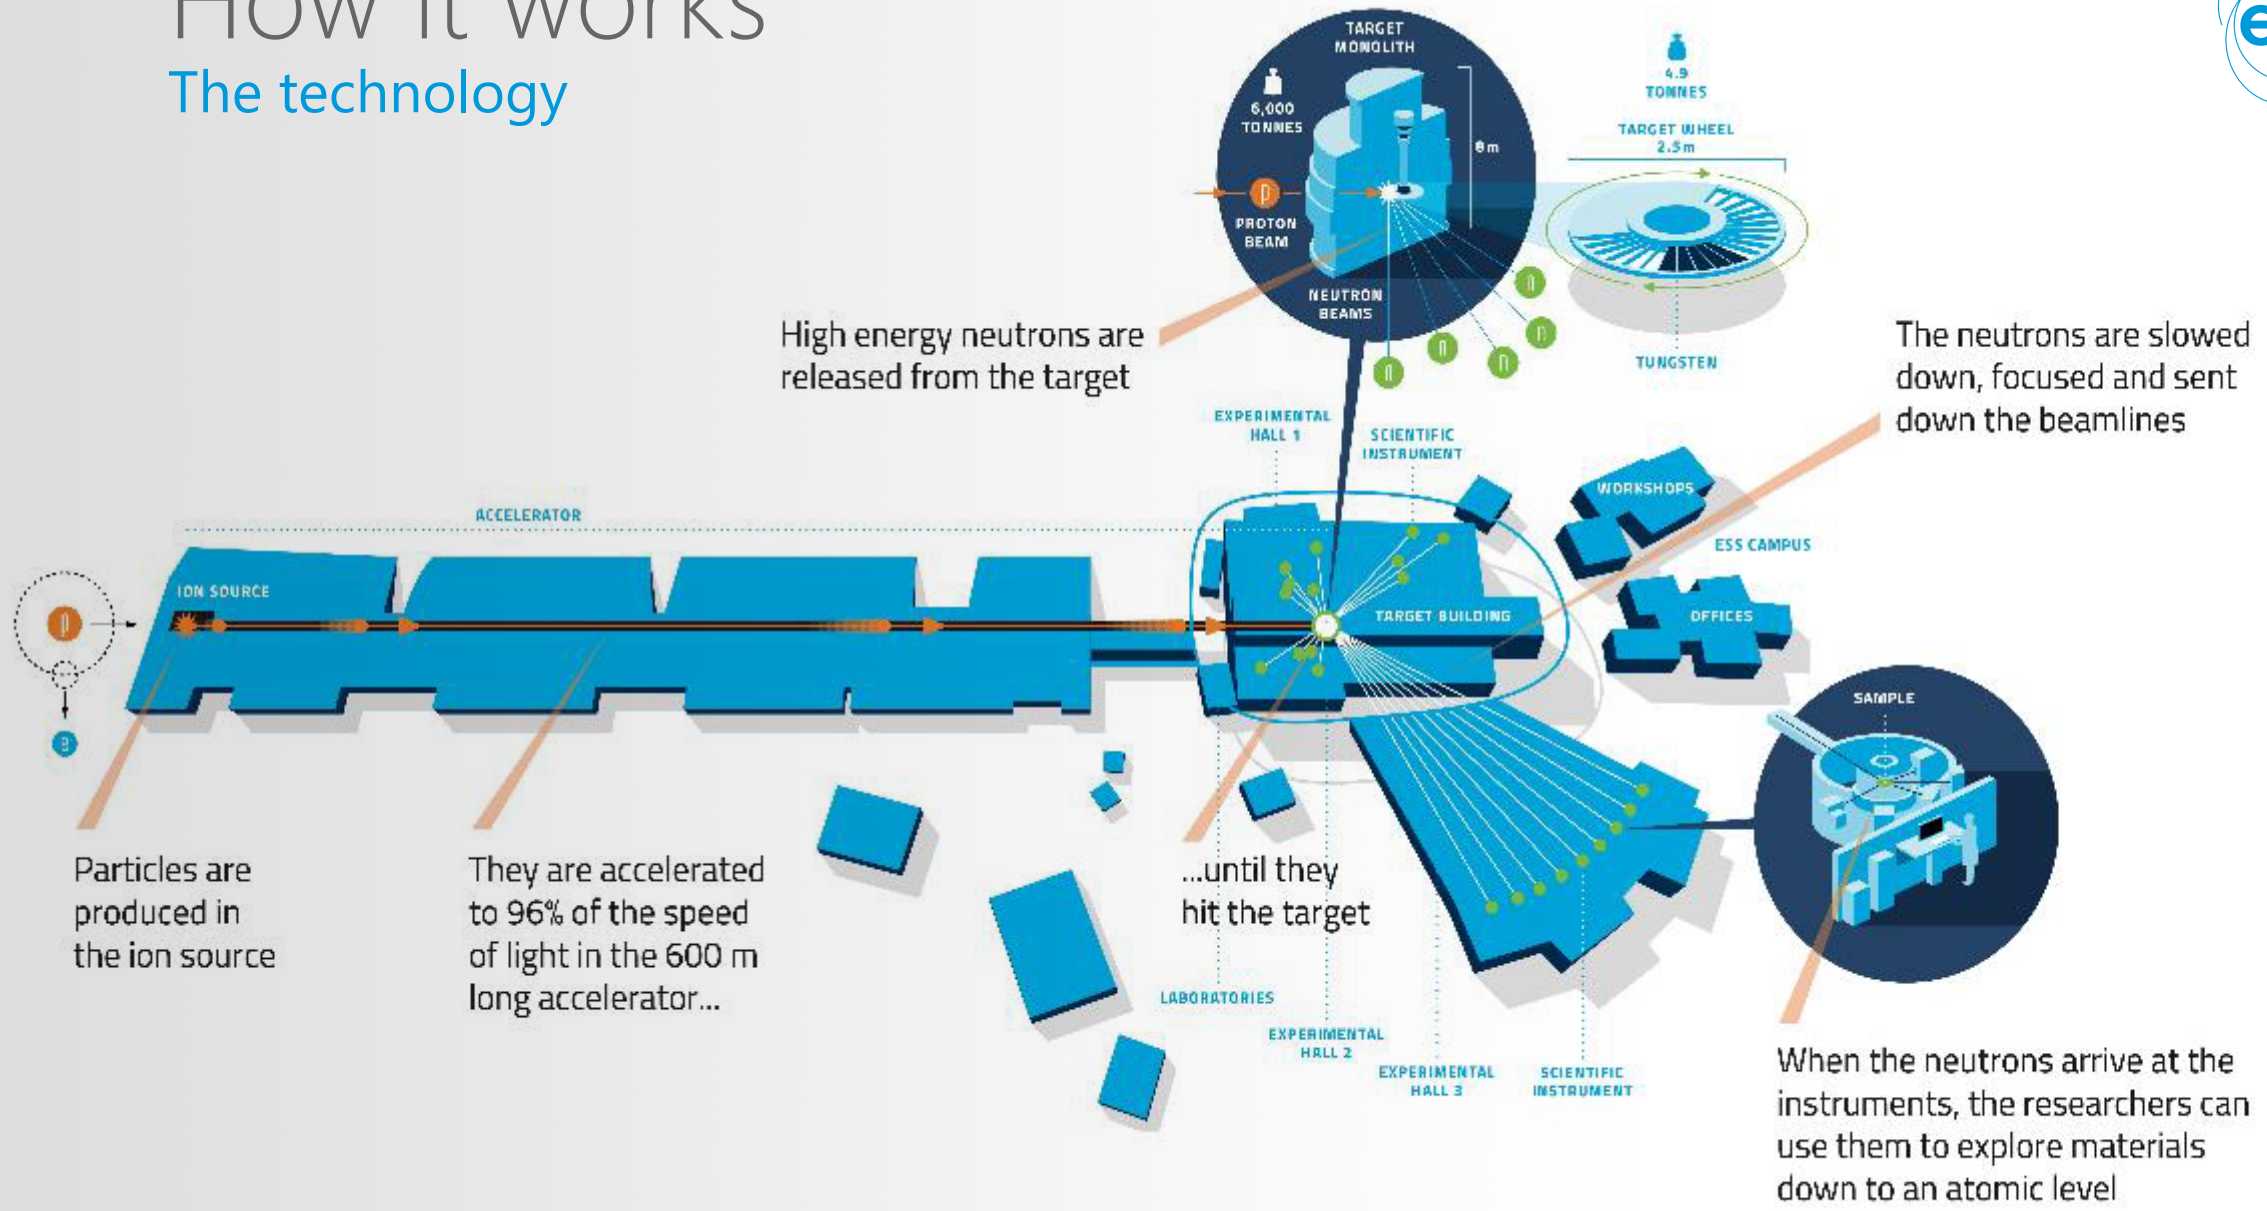

- Construction on the ESS site began in 2014
- Accelerator + target & first neutrons in 2023
- Instrument rollout 2024 – 2027 (15 instruments)

# How it works

## The technology

# Neutron scattering simplified

Labs prepare the samples locally

Neutrons tell us:  
Where the atoms are (pattern)  
What they are doing (flight time)

Sample environment to vary temperature, apply magnetic fields, pressure, humidity, in-operando processes like operating battery, welding, forging, etc.

ESS will provide support in the form of data analysis packages, user support, data storage, etc.

# Facts about ESS

5 MW  
particle  
accelerator  
2 MW at start

15  
instruments  
next step is 22

3 000  
guest scientists visiting  
yearly  
to conduct experiments

800  
experiments per  
year

BREEAM  
Renewable  
energy & waste  
heat recovery

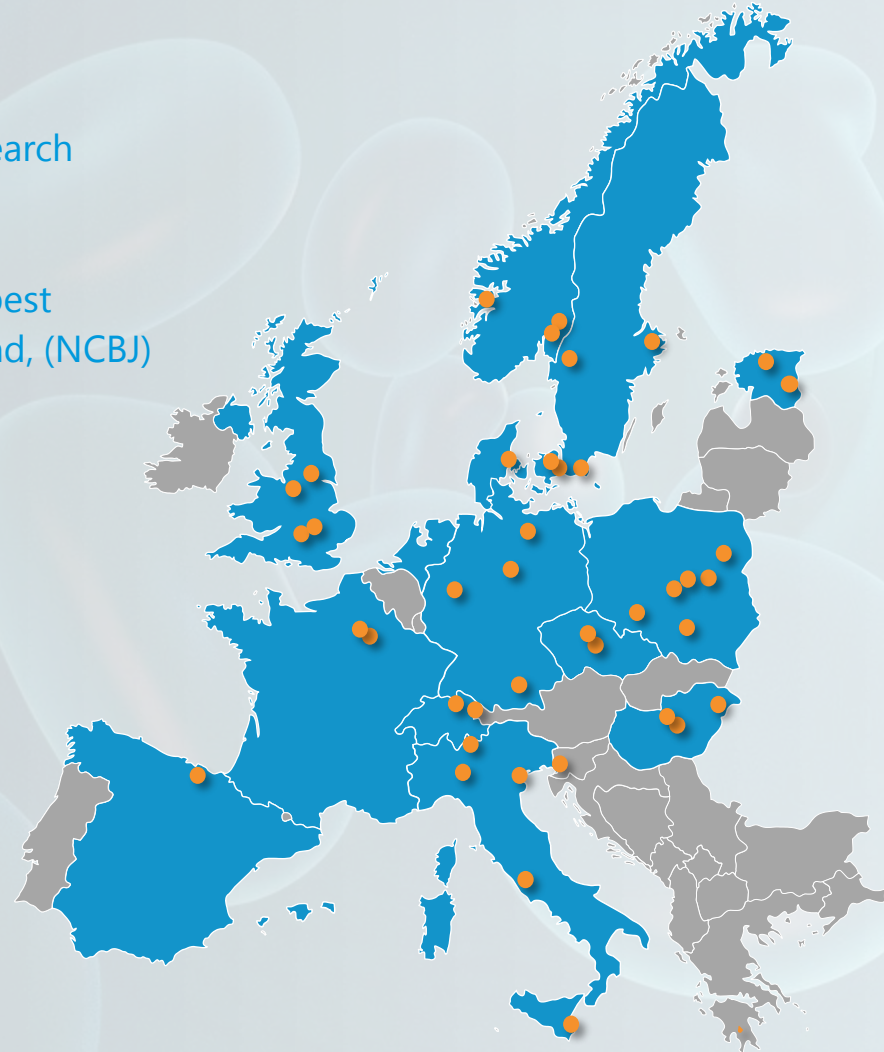

# Unique international project

## How will it be built?

# Data Management and Software Center

## Enabling science

*DMSC mission:  
To use the techniques and methods of scientific  
computing  
to facilitate, enable and advance the scientific research to  
be carried out using the neutron beam instruments at  
the  
European Spallation Source.*

## Organization

# Data Management and Software Center

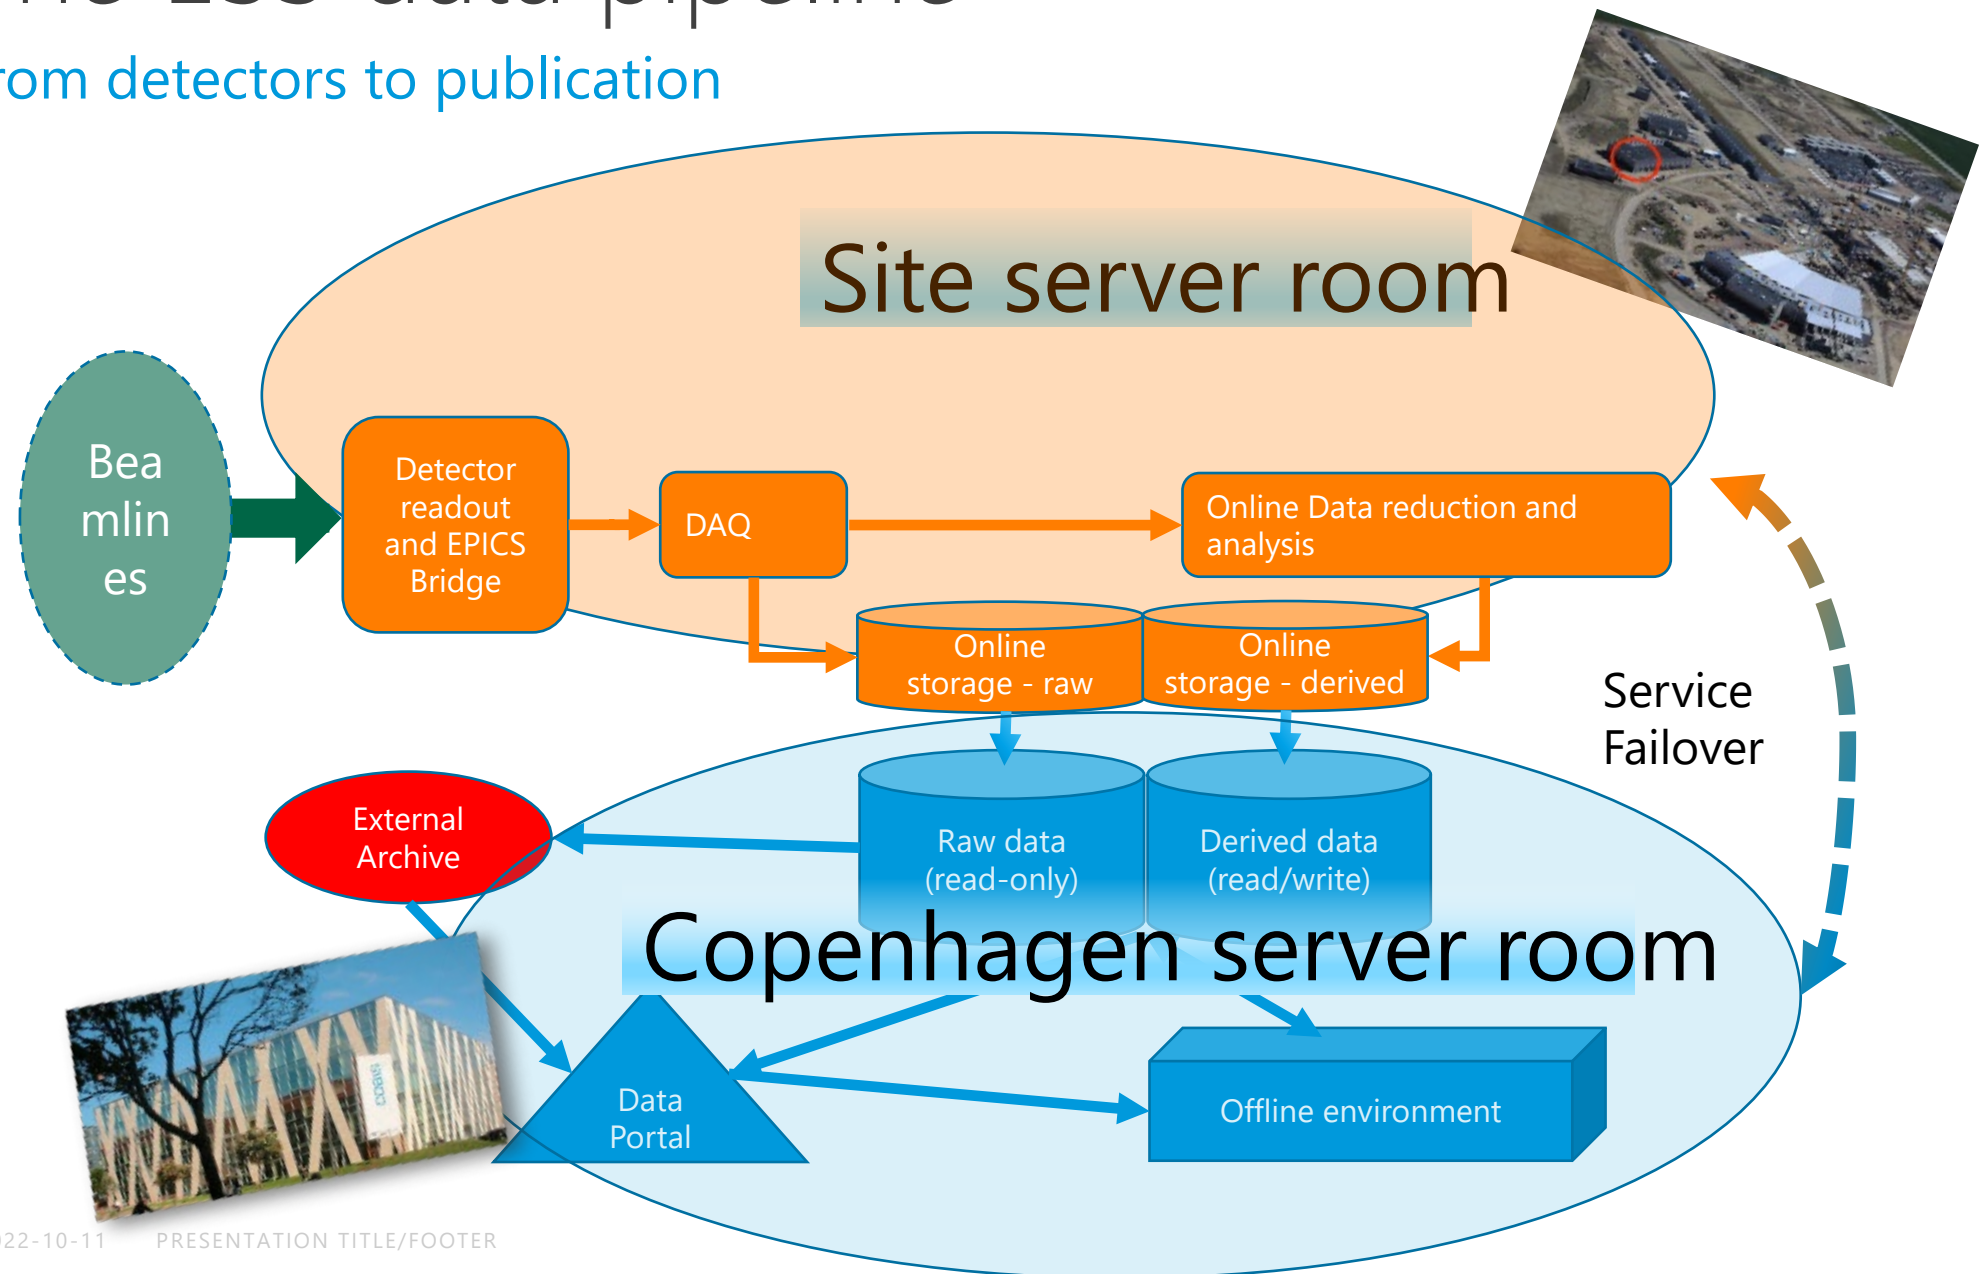

Supporting the full workflow from idea to publication

# The ESS data pipeline

From detectors to publication

# ESS as a scientific cloud provider

## Bringing the results to the end-user

### **Boundary conditions for ESS**

- ESS adheres to the FAIR principles for scientific data
- ESS must ensure a good and smooth user experience for users conducting experiments.
- Data sets at ESS ranges from gigabytes to double digit terabytes per experiment plus derived data!

### **Ambition for how to work with data at ESS:**

- Users are allowed to download data and use it in accordance with the ESS DMP but...
- We would rather that users find DMSC service the better alternative and that DMSC services will always be the preferred choice.
- Users will thereby work in "the cloud" and ESS can leverage resources and combined data sets from other facilities in the \*OSC's
- Making ESS a cloud provider in the Open Science Clouds.

# Concrete technologies used at DMSC

## Bringing the results to the end-user

- **ESS is part of the PaNOSC project (Photon and Neutron Open Science Cloud) collaborating on common solutions for:**
  - E-learning platform supporting courses and virtual experiments ([pan-training.eu](http://pan-training.eu))
  - Data catalogue (SciCAT)
  - VISA (Virtual Infrastructure for Scientific (data)analysis) providing a front-end to users for data reduction and analysis. VISA is developed by ILL.
  - Integration with EOSC, including making ESS services part of the EOSC service catalogue, federated AI, long term data archival and data sharing.
- **Virtualization and containerization**
  - OpenStack, OpenShift
  - Kubernetes, Docker etc.
- **HPC and backend storage**
  - Classic HPC using SLURM plus Jupyter frontends.
  - SpectrumScale (GPFS), ZFS (in the longer term object storage is likely to be used along side block storage)

# DMSC data center consists of

## Hardware

### The Datacenter consists of:

- A HPC cluster consisting of 95 nodes and 2656 cores+ 2x A100 GPU cards.
- Storage systems:
  - ZFS based home directories – 80TB total
  - ZFS based storage for project data – 320TB total.
  - Lustre for online scratch – 66TB fast storage. To be sunset in 2022.
  - Lenovo based GPFS SpectrumScale 2 x 850TB
  - A 120TB ZFS based backup system at I2 (DeIC) in Lyngby DK. To be sunset in 2022.
- A 3 host 1.1TB RAM virtualization system. Including 2 x 10TB SAS based storage systems
- 10 nodes (32 to 96 cores each) for virtualization being deployed on OpenStack in both sites.
- Mac OSX servers (1 MacPro server and 10 Mac Minis)
- 1GBE, 10GBE and 100GBE Ethernet
- QDR and HDR InfiniBand for cluster- and storage interconnect. QDR to be sunset.
- Total of 46 servers in Lund for event formation, KAFKA cluster and filewriters.
- 10GBE MPLS based site-to-site link connecting COBIS and H01

# DMSC data center consists of

## Software and services

### DST is managing the following systems and services:

- Gitlab Community
- Jenkins CI/CD
- SLURM for cluster management
- Jupyter notebooks and Jupyter hub
- Mediawiki servers
- OwnCloud available for ESS as a whole – 17TB data
- Foreman/Puppet allowing dev. Teams to spin up machines for dev and test.
- VISA – current in a proof of concept setup
- Build servers for software projects
- Kubernetes

### Infrastructure systems:

- OpenLDAP
- DNS
- OSSEC, Icinga, Graylog, GLPI for monitoring and asset management
- Yum and apt repository servers
- Etc.

### Data Analysis, in the cloud

VISA (Virtual Infrastructure for Scientific Analysis) makes it simple to create compute instances on the data analysis infrastructure to analyse your experimental data using just your web browser

 [Sign in with your user account](#)

#### Analyse your data

Create a new [compute instance](#) and use your web browser to access a Remote Desktop or JupyterLab to start analysing your experimental data

#### Collaborate with your team

Share your compute instance with other members of your team to [collaborate together](#) in real time

#### No need to install software

The compute instances come with pre-installed [data analysis software](#) so you can start analysing your experimental data immediately

Experiments: TEST-PROP (Instrument 1, Feb 2021)

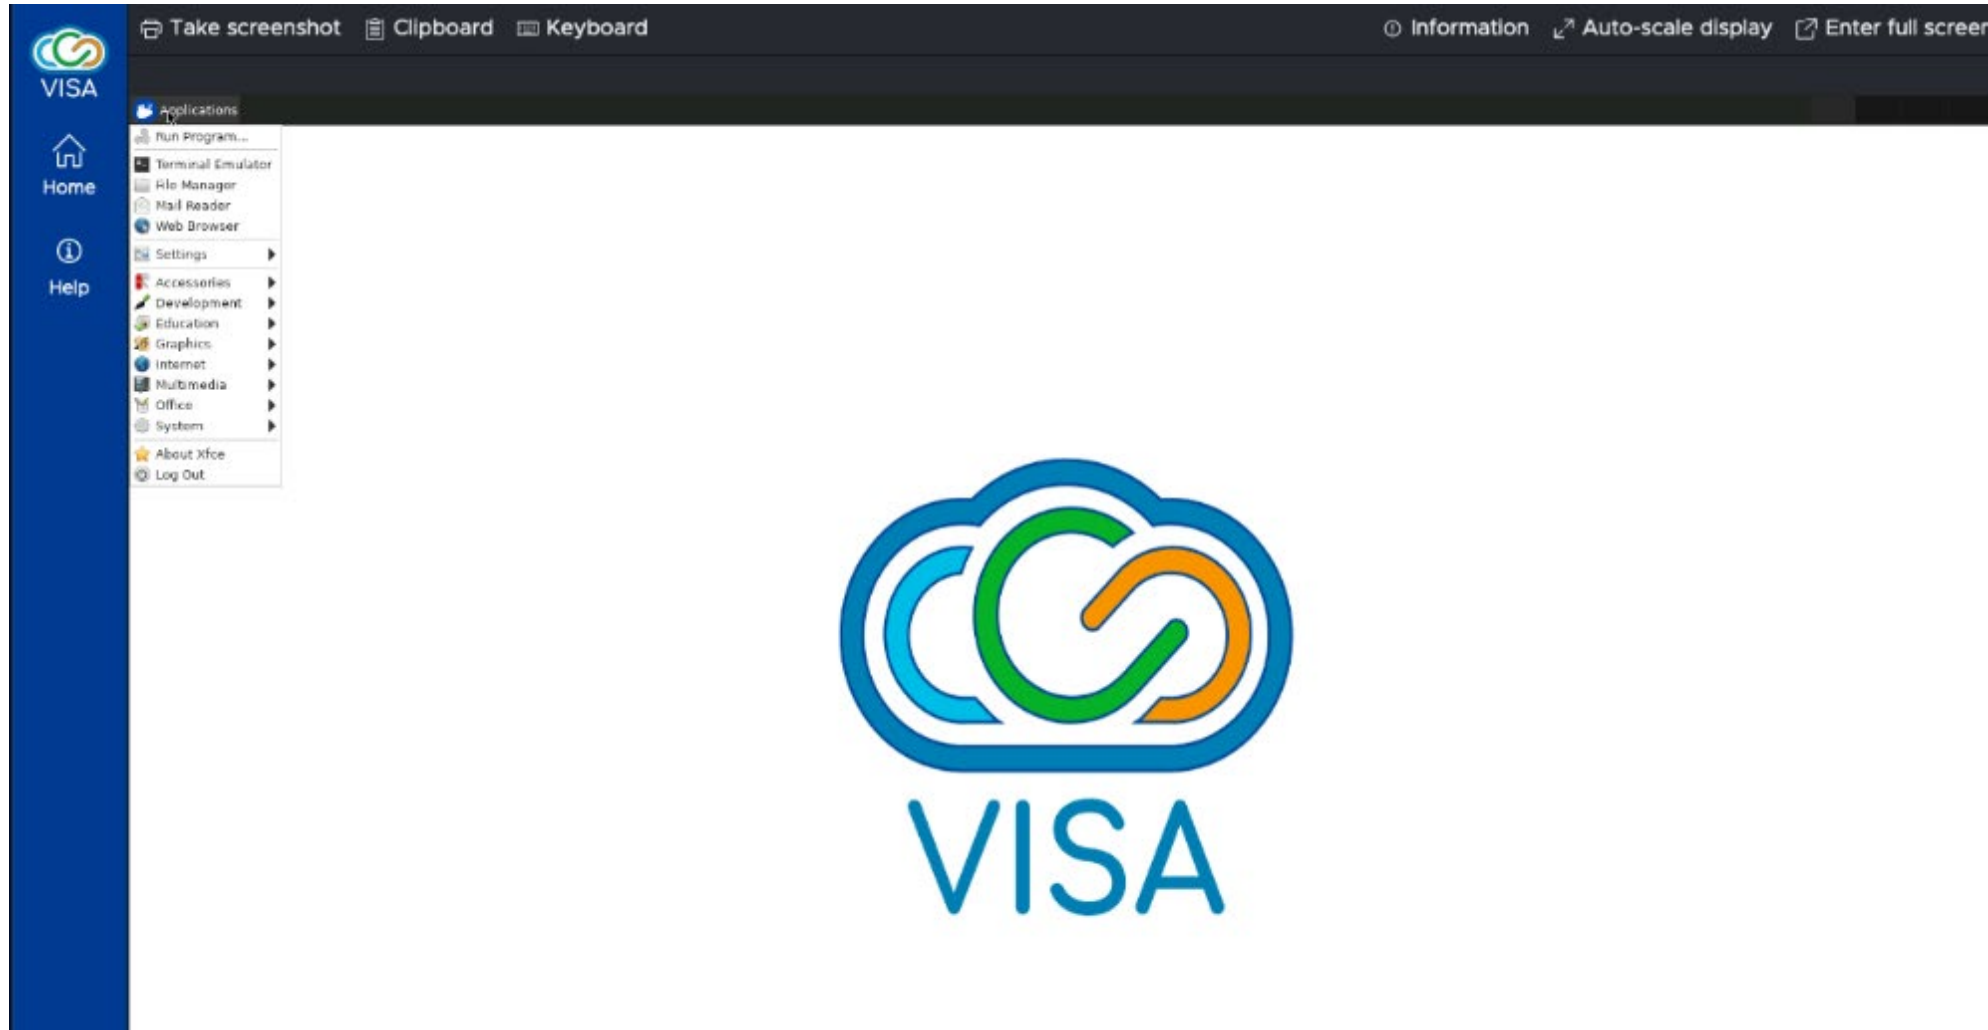

Remote Desktop

JupyterLab

# VISA

## Remote desktop connection

# VISA

## Remote desktop connection

The screenshot displays a remote desktop session with a VISA interface on the left. The main window shows a JupyterLab environment with a file explorer on the left, a code editor in the center, and a terminal at the bottom. The code editor contains the following Python code:

```
[6]: import scipy as sc
[7]: import numpy as np
[7]: var = sc.Variable(dims=['y', 'x'], values=np.random.randn(4,5))
      dims={'y': 4, 'x': 5}, unit='dimensionless', variances=False)
[4]: var
[4]: scipp.Variable (160 Bytes)
      [y: 4, x: 5] float64 0.23, 0.58, ..., 0.24, 0.86
[5]: sc
[5]: <module 'scipy' from '/home/admin/anaconda3/lib/python3.8/site-packages/scipy/_..._init_.py'>
[ ]:
```

The terminal window shows a traceback error:

```
Traceback (most recent call last):
  File "<string>", line 1, in <module>
NameError: name 'scipp' is not defined
```

# VISA

## JupyterHub connection

The screenshot displays a JupyterLab environment. On the left is a sidebar with the VISA logo and navigation icons for Home and Help. The main area is divided into three panes:

- File Browser:** Shows a file tree with folders like Desktop, Documents, Downloads, Music, Pictures, Public, Templates, and Videos, all last modified 5 minutes ago. A file named 'Untitled.ipynb' is selected, showing it was modified 'seconds ago'.
- Code Editor:** Contains the following Python code:

```
[2]: import numpy as np
import matplotlib.pyplot as plt
from IPython.display import clear_output

n = 10
a = np.zeros((n, n))
plt.figure()

for i in range(n):
    plt.imshow(a)
    plt.show()
    a[i, i] = 1
    clear_output(wait=True)
```
- Figure 2:** A 10x10 plot showing a diagonal line of yellow squares on a dark purple background, representing the identity matrix. The x and y axes are labeled from 0 to 8.

# Summing up

## ESS as a cloud service for neutron scattering research

- Data sets are too big and too expensive to be transported by portable storage devices.
- Data analysis requires considerable computational resources.
- ESS will strive to facilitate good and efficient data analysis by
  - Ensuring that the relevant software packages are developed and maintained.
  - That computational resources are available in a convenient but secure way.
  - That scientists does not have to care about the “how’s” but only the “what’s” – it should not be up to a scientist to find out how a computational run can be done – only which runs is relevant.
  - Working with ESS data should be doable from any location at any time.
  - The tax payers should get at much science out of an experiment as possible.
- **The purpose of DMSC is to ensure this – hence ESS is dedicated to provide the above.**
